Define the Problem Statements

Date	30 August 2026
Project Name	Automated Network Request Management
Maximum Marks	2 Marks

Problem Statement

In modern organizations, network-related service requests such as new network connections, network relocations, device-related requests, and connectivity requirements often involve multiple manual activities. Traditional request processing may lead to **delays, incorrect routing, approval bottlenecks, repetitive tasks, and poor visibility of request status**.

The proposed **Automated Network Request Management in ServiceNow** addresses these issues by providing a centralized self-service platform for submitting network requests and automating their processing. The system collects the necessary request details through a structured Service Catalog, routes requests for approval, creates the required records, and sends notifications according to the request status.

Key Problems Identified

1. Manual Request Processing

Network service requests often involve several manual steps, which can increase processing time and require additional effort from IT teams.

2. Approval Delays

Requests that need authorization may take longer when approvals are performed manually, resulting in unnecessary waiting time.

3. Incorrect or Delayed Routing

Without an automated workflow, requests may be assigned to the wrong team or may take additional time to reach the appropriate person.

4. Lack of Transparency

Users and IT staff may not have clear visibility into the current status and progress of a submitted network request.

5. Repetitive Data Entry

Manually entering request information multiple times can increase workload and may result in incomplete or incorrect details.

6. Unstructured Request Submission

Requests submitted without a standard format can make it difficult for IT teams to collect all the required information.

7. Notification Gaps

Users may not receive timely notifications about request approvals, processing progress, or completion.

Problem Statement Summary

To develop an automated ServiceNow-based network request management system that simplifies request submission, standardizes information collection, automates approval and record creation, provides timely notifications, and improves visibility throughout the request lifecycle.

This solution supports the project's objective of streamlining network service requests by using ServiceNow's **Service Catalog, workflow automation, approval mechanisms, notification features, and record management capabilities.**
